R Abeygunawardene

Consultant neurosurgeon

A 79-year-old lady presented with a two month history of symptoms of raised intracranial pressure. The patient had a significant past medical history. Her Karnofsky score was below 50 on presentation. The patient was treated conservatively and unfortunately succumbed to her condition and died a month after presentation. This is a pathological coronal section through her brain.

1. What macroscopic features in the above pathological section would lead to your diagnosis of the condition?
2. What is the Karnofsky score?
3. Describe the pathophysiological process that likely led to her demise

Answers on page 69 .
